Initial lymphatics - Morphology and function of the ... Abstract. Cardiac endothelial cells, regardless of whether they are from endocardial or from coronary (micro)vascular origin, directly modulate performance of the subjacent cardiomyocytes, resulting in control of the onset of ventricular relaxation and rapid filling of the heart. This review summarizes major features of the morphology, embryology,...

The cardiac endothelium: Functional morphology ... Barrier Function: The endothelium acts as a barrier between the blood and the rest of the body tissue while being selectively permeable for certain chemicals and white blood cells to move across from blood to tissue or for waste and carbon-dioxide to move from tissue to blood. This property of endothelial cells is especially investigated in the blood-brain-barrier system.

Endothelium. These cells have unique functions in vascular biology. These functions include fluid filtration, such as in the glomerulus of the kidney, blood vessel tone, hemostasis, neutrophil recruitment, and hormone trafficking. Endothelium of the interior surfaces of the heart chambers is called endocardium.

Abstract. The primary functions of the endothelium include regulation of (1) vascular tone, (2) blood coagulation and fibrinolysis, (3) inflammatory responses and (4) vascular wall remodelling. The various functions of the endothelium operate under a delicate balance in order to ensure its optimal function.
