Semi Active Suspension Control Improved

Active suspension is a type of automotive suspension that controls the vertical movement of the wheels relative to the chassis or vehicle body with an onboard system, rather than in passive suspension where the movement is being determined entirely by the road surface. Active suspensions can be generally divided into two classes: pure active suspensions, and adaptive/semi-active suspensions.

A COMPARISON BETWEEN PASSIVE & SEMI ACTIVE SUSPENSION SYSTEMS

Active Body Control, or ABC, is the Mercedes-Benz brand name used to describe hydraulic fully active suspension, that allows control of the vehicle body motions and therefore virtually eliminates body roll in many driving situations including cornering, accelerating, and braking. Mercedes-Benz has been experimenting with these capabilities for automobile suspension since the air suspension of ...

Chassis products determine the basic functions of automobiles - moving, turning and stopping. By coordinating and harmonizing the chassis with various control technologies, we can count on improved safety and comfort. In order to aim for an even higher level of safety, the core elements of brakes, steering, and suspension have been electrified and subjected to electronic control.
